Apollo

TGS 2104 - for detection of Gasoline Engine Exhaust Gas

Features:

- * High sensitivity to exhaust gases emitted by gasoline-fueled engines
- * Long life and low cost
- * Uses simple electrical circuit

The sensing element is comprised of a metal oxide semiconductor layer formed on an alumina substrate of a sensing chip together with an integrated heater. In the presence of a detectable gas, the sensor's conductivity increases depending on the gas concentration in the air. A simple electrical circuit can convert the change in conductivity to an output signal which corresponds to the gas concentration.

The TGS 2104 has high sensitivity and quick response to exhaust gases emitted by gasoline-fueled engines. As a result of this feature, TGS2104 is an ideal sensor for application in automatic damper control systems for automobile ventilation.

The figure below represents typical sensitivity characteristics, all data having been gathered at standard test conditions (see reverse side of this sheet). The Y-axis is indicated as sensor resistance ratio (Rs/Ro) which is defined as follows:

Rs = Sensor resistance in displayed gases at various concentrations Ro = Sensor resistance in clean air

Sensitivity Characteristics: Sensor Response Pattern: 1000 10 100 Air air 10 ppm H2 air Sensor resistance (kΩ) C10H22 со H₂ 10 .01 10 100 1000 0 2 8 10 1 4 6 Time (min.) Gas concentration (ppm)

IMPORTANT NOTE: OPERATING CONDITIONS IN WHICH FIGARO SENSORS ARE USED WILL VARY WITH EACH CUSTOMER'S SPECIFIC APPLICATIONS. FIGARO STRONGLY RECOMMENDS CONSULTING OUR TECHNICAL STAFF BEFORE DEPLOYING FIGARO SENSORS IN YOUR APPLICATION AND, IN PARTICULAR, WHEN CUSTOMER'S TARGET GASES ARE NOT LISTED HEREIN. FIGARO CANNOT ASSUME ANY RESPONSIBILITY FOR ANY USE OF ITS SENSORS IN A PRODUCT OR APPLICATION FOR WHICH SENSOR HAS NOT BEEN SPECIFICALLY TESTED BY FIGARO

Applications:

* Automobile ventilation control

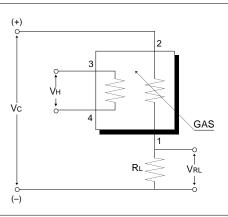

The figure below represents the typical response pattern of the TGS2104 when the atmosphere changes from clean air to the listed gas concentrations and then reverts back to clean air again.

Sensor resistance ratio (Rs/Ro)

Apollo

Basic Measuring Circuit:

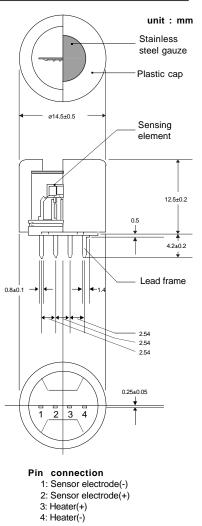

The sensor requires two voltage inputs: heater voltage (V_H) and circuit voltage (V_C). The heater voltage (V_H) is applied to the integrated heater in order to maintain the sensing element at a specific temperature which is optimal for sensing. Circuit voltage (V_C) is applied to allow measurement of voltage (V_{RL}) across a load resistor (R_L) which is connected in series with the sensor. A common power supply circuit can be used for both Vc and V_H to fulfill the sensor's electrical requirements. The value of the load resistor (R_L) should be chosen to optimize the alarm threshold value, keeping power dissipation (Ps) of the semiconductor below a limit of 15mW. Power dissipation (Ps) will be highest when the value of Rs is equal to R_L on exposure to gas.

Specifications:

| Model number | | | TGS 2104 | |
|--|-------------------------------------|----|--|---------------------------------------|
| Sensing element type | | | S1 | |
| Standard package | | | Plastic (P3) | |
| Target gases | | | Gasoline exhaust (H2,CO,HC) | |
| Typical detection range | | | 10 ~ 1,000 ppm | |
| Standard circuit conditions | Heater voltage | Vн | 7.0±0.35V DC | |
| | Circuit voltage | Vc | 15.0V DC Max. | Ps ≤ 15mW |
| | Load resistance | R∟ | Variable | Ps ≤ 15mW |
| Electrical characteristics under standard test conditions | Heater resistance | Rн | $50\pm5\Omega$ at room temp. | |
| | Heater current | Ін | 91mA | |
| | Heater power consumption | Рн | 640mW | VH = 7.0V DC |
| | Sensor resistance | Rs | 10 ~ 80 kΩ in air | |
| | Sensitivity (change ratio of Rs) | | 0.3 ~ 0.6 | R <u>s (10ppm of H</u> 2) Rs (air) |
| Standard test conditions | Test gas conditions | | Air at 20±2°C, 65±5%RH | |
| | Circuit conditions | | $\label{eq:RL} \begin{array}{l} {\sf RL} = 10 k \Omega {\pm} 1\%, \mbox{ Vc} = 7.0 {\pm} 0.2 \mbox{ VDC}, \\ {\sf VH} = 7.0 {\pm} 0.2 \mbox{ VDC} \end{array}$ | |
| | Conditioning period before test | | 7 days | |

Structure and Dimensions:

The value of power dissipation (Ps) can be calculated by utilizing the following formula:

Sensor resistance (Rs) is calculated with a measured value of V_{RL} by using the following formula:

$$\mathsf{Ps} = \frac{(\mathsf{Vc} - \mathsf{V}_{\mathsf{RL}})^2}{\mathsf{Rs}}$$
